

# “ $\Omega > 1$ ”

## “Sky-Notes” for the Open University Astronomy Club.

**October 2025.**

### **Recent Events.**

If OUAC members have any images and/or reports of recent events please contact Sheridan so that he can put them on the Club website.

### **Forthcoming Meetings.**

#### **OUAC “Clubnight”.**

**Following the decision made at the Special General Meeting held on 2<sup>nd</sup> September “Clubnights” are suspended until further notice.**

**Other activities such as Outreach and Observing Sessions will continue with details advised to members as per existing circulation.**

**Monthly “Sky-Notes” will continue to be produced and circulated to OUAC members and published on the website.**

**These “Sky-Notes” will now be shared with the Bedford Astronomical Society.**

### **Highlights of the Month.**

20 <sup>th</sup> /21 <sup>st</sup> .	Peak of Orionids meteor shower. See notes below.
26 <sup>th</sup>	British Summer Time <b>ends at 01:00 UT</b> .
29 <sup>th</sup>	Mercury at Greatest Eastern Elongation.
31 <sup>st</sup>	“Halloween”.
<b>Mercury.</b>	Very poor evening apparition for northern observers.
<b>Venus.</b>	Prominent object low in the E predawn sky.
<b>Mars.</b>	Not observable.
<b>Jupiter.</b>	Prominent object for “early hour” dawn observation.
<b>Saturn.</b>	Available for evening to “early hour” observation.
<b>Uranus.</b>	Available for late evening to dawn observation.
<b>Neptune.</b>	Available for evening to “early hour” observation.
<b>Dwarf Planets, Asteroids, Comets and Meteor showers.</b> See notes below.	

### **Software.**

A very useful item of Planetarium software is “Stellarium” and it’s FREE!  
Go to their website and download it and the associated user manual.

## 1. The Solar system.

**Note all times shown are UT.  
Add one hour when British Summer Time is in operation.**

### Earth.

British Summer Time ends at 01:00 (UT) on 26<sup>th</sup> October. **Clocks go BACK one hour!**

#### Aurora.

Keep tuned to the [www.spaceweather.com](http://www.spaceweather.com) site for updates.  
Subscribe (free!) to the UK AuroraWatch website to receive alerts.

#### Artificial Satellites.

For details of “Bright Satellites” passes go to the “Heavens Above” website and follow the instructions set-up for your location. Alternatively go to the “spaceweather” website and click the “Flybys” button and follow the instructions to set-up forecasts for your location. Add to your “favourites”.

#### Sunrise and Sunset.

**Bedford.**  
**Latitude 52° 6.9'N Longitude 0° 28.1'W**

Date.	Rise.	Transit.	Set.
01	06 <sup>h</sup> 03 <sup>m</sup>	11 <sup>h</sup> 51 <sup>m</sup>	17 <sup>h</sup> 39 <sup>m</sup>
08	06 <sup>h</sup> 15 <sup>m</sup>	11 <sup>h</sup> 49 <sup>m</sup>	17 <sup>h</sup> 23 <sup>m</sup>
15	06 <sup>h</sup> 27 <sup>m</sup>	11 <sup>h</sup> 47 <sup>m</sup>	17 <sup>h</sup> 07 <sup>m</sup>
22	06 <sup>h</sup> 39 <sup>m</sup>	11 <sup>h</sup> 46 <sup>m</sup>	16 <sup>h</sup> 52 <sup>m</sup>
29	06 <sup>h</sup> 52 <sup>m</sup>	11 <sup>h</sup> 45 <sup>m</sup>	16 <sup>h</sup> 38 <sup>m</sup>

Produced using “Starry Night Pro”.

### The Sun.

#### Observing.

To prevent permanent damage to your eyes avoid looking at the Sun directly and never with binoculars or a telescope unless special (expensive!) filters are used. The safest way is the simplest – project the image of the Sun onto grey or white card.

If you can observe in h-alpha where the rewards are much greater.

**Solar Cycle 25** is continues to produce good activity.

Keep in touch with the **Solar Dynamics Observatory** satellite at <http://sdo.gsfc.nasa.gov/>  
Add the “Spaceweather” and the “Soho Lasco C3” websites to your “favourite” websites.

## The Moon.

### Phases:

Produced using "LunarPhase Pro".

<b>Full.</b>	07 <sup>d</sup> 03 <sup>h</sup> 47 <sup>m</sup>	A "Supermoon".
<b>Last Quarter.</b>	13 <sup>d</sup> 18 <sup>h</sup> 13 <sup>m</sup>	
<b>New.</b>	21 <sup>d</sup> 12 <sup>h</sup> 26 <sup>m</sup>	
<b>First Quarter.</b>	29 <sup>d</sup> 16 <sup>h</sup> 21 <sup>m</sup>	

### Apsides:

<b>Perigee.</b>	08 <sup>d</sup> 13 <sup>h</sup>	Diameter. 33' 12"	Distance. 359,818km.
<b>Apogee.</b>	23 <sup>d</sup> 23 <sup>h</sup>	Diameter. 29' 23"	Distance. 406,444km.

## Observing.

### For northern observers:

- The waxing crescent Moon is not well placed.
- The waxing gibbous Moon is becoming better placed.
- The Full Moon is well placed.
- The waning gibbous Moon is very well placed.
- The waning crescent Moon is well placed.

## The Moon cont.

Observe the regions along the terminator (sunrise and sunset on the Moon) where the low angle of the Sun highlights lunar topography. A basic lunar map is all you need to get started. *Sky & Telescopes* “Lunar 100 Card” is another good starting point. If you are starting out on photography and/or imaging the Moon provides an excellent target.

Clear October predawn skies provide excellent opportunities to observe and image the well placed waning gibbous and waning crescent Moon.

### Lunar Occultations.

Details of Lunar Occultations can be found in current *BAA Handbook* and monthly periodicals such as *Astronomy Now* and *Sky at Night*.

Unlike the gradual disappearance of a planet (small disc) a star vanishes instantly demonstrating that it is a point source of light as viewed from the earth. For all occultation events start observing 10 to 15 minutes before the predicted time to identify the required star and to allow for slightly different time if you are not at Greenwich. Use an accurate watch to record the time that *you* observe the occultation remembering that times are UT not BST. Enter details in your observing log.

## The Planets.

### Mercury.

Unlikely to be spotted very low in the SW evening twilight during a poor evening apparition for northern observers.

**Greatest Elongation E (23.9°) on 29<sup>th</sup>.**

Moon close on 23<sup>rd</sup>.

Date.	Mag.	Dia.	Phase.	Rise.	Transit.	Set.
01	-0.5	4.9"	0.93	07 <sup>h</sup> 22 <sup>m</sup>	12 <sup>h</sup> 40 <sup>m</sup>	17 <sup>h</sup> 59 <sup>m</sup>
29	-0.1	6.6"	0.64	09 <sup>h</sup> 25 <sup>m</sup>	13 <sup>h</sup> 18 <sup>m</sup>	17 <sup>h</sup> 11 <sup>m</sup>

### Venus.

Prominent object low in the E predawn sky.

Moon close on 19<sup>th</sup>.

Date.	Mag.	Dia.	Phase.	Rise.	Transit.	Set.
01	-3.9	11"	0.91	03 <sup>h</sup> 43 <sup>m</sup>	10 <sup>h</sup> 25 <sup>m</sup>	17 <sup>h</sup> 07 <sup>m</sup>
31	-3.9	10"	0.96	05 <sup>h</sup> 18 <sup>m</sup>	10 <sup>h</sup> 45 <sup>m</sup>	16 <sup>h</sup> 11 <sup>m</sup>

### Mars.

Not observable.

Moon close on 23<sup>rd</sup>.

Date.	Mag.	Dia.	Phase.	Rise.	Transit.	Set.
-	-	-	-	-	-	-

Mission details and progress of numerous “Orbiters” and “Landers” are on the appropriate websites.

### Jupiter.

Prominent object well placed for “early hour” observation.

The beginning of a fine apparition for northern observers!

Moon close on 13<sup>th</sup>.

Date.	Mag.	Dia.	Rise.	Transit.	Set.
01	-2.1	37"	22 <sup>h</sup> 49 <sup>m</sup>	06 <sup>h</sup> 58 <sup>m</sup>	15 <sup>h</sup> 04 <sup>m</sup>
31	-2.3	40"	21 <sup>h</sup> 04 <sup>m</sup>	05 <sup>h</sup> 10 <sup>m</sup>	13 <sup>h</sup> 14 <sup>m</sup>

See BAA *Handbook* and/or monthly periodicals for satellite phenomena.

Simulation of events can be produced on “Stellarium” or similar software.

## Saturn.

Available for observation and imaging from evening to “early hours”.  
The “Rings” are almost edge-on.  
Moon close on 6<sup>th</sup>.

Date.	Mag.	Dia.	Rise.	Transit.	Set.
01	+0.7	19"	17 <sup>h</sup> 28 <sup>m</sup>	23 <sup>h</sup> 14 <sup>m</sup>	05 <sup>h</sup> 04 <sup>m</sup>
31	+0.9	18"	15 <sup>h</sup> 26 <sup>m</sup>	21 <sup>h</sup> 09 <sup>m</sup>	02 <sup>h</sup> 55 <sup>m</sup>

See monthly periodicals for satellite phenomena.  
Simulate events on “Stellarium” or similar software.

## Uranus.

Available for late evening to dawn observation  
Easy to locate few degrees below The Pleiades” (M45) star cluster.  
Moon close on 10<sup>th</sup>.

Date.	Mag.	Dia.	Rise.	Transit.	Set.
01	+5.6	3.7"	19 <sup>h</sup> 18 <sup>m</sup>	03 <sup>h</sup> 18 <sup>m</sup>	11 <sup>h</sup> 14 <sup>m</sup>
31	+5.6	3.8"	17 <sup>h</sup> 17 <sup>m</sup>	01 <sup>h</sup> 16 <sup>m</sup>	09 <sup>h</sup> 11 <sup>m</sup>

## Neptune.

Available for evening to “early hour” observation.  
Easy to locate a few degrees northeast of Saturn.  
Moon close on 6<sup>th</sup>.

Date.	Mag.	Dia.	Rise.	Transit.	Set.
01	+7.8	2.4"	17 <sup>h</sup> 25 <sup>m</sup>	23 <sup>h</sup> 22 <sup>m</sup>	05 <sup>h</sup> 24 <sup>m</sup>
31	+7.8	2.3"	15 <sup>h</sup> 26 <sup>m</sup>	21 <sup>h</sup> 22 <sup>m</sup>	03 <sup>h</sup> 22 <sup>m</sup>

At mag +13.5 Neptune’s largest satellite, Triton, provides a good challenge for 8” telescopes under favourable sky conditions and when Triton is at max elongation E or W of Neptune. Use a high magnification - x200 or greater. Use “Stellarium” (Freeware) or similar software to determine favourable E and W elongations.

## Dwarf Planets.

### Ceres.

Located in Cetus. Mag +7.6 at **Opposition on 2<sup>nd</sup>**.

### Eris (2003 UB313).

A mag +18.7 target located in Cetus. At **Opposition on 18<sup>th</sup>**.

### Haumea.

A mag +17.3 CCD target located in Boötes. Becoming lost in WNW evening twilight.

### MakeMake.

A mag +17 CCD target in Coma Berenices.

### Pluto.

A 14<sup>th</sup> mag object located in Capricornus low in the SW evening sky.

**Asteroids.** (Approx Mag +10.5 or brighter).

**Vesta (4).**

A 7<sup>th</sup> mag object in Ophiuchus low in the SW evening twilight.

**Io (85).**

Located Pisces. Mag +10.5 at opposition on 16<sup>th</sup>.

**Pallas (2).**

A 10<sup>th</sup> mag object located in Aquila.

Up to date details of comets can be found on the “Heavens above” website and monthly periodicals.

## Comets.

### Four comets to attract your attention!

**C/2025 R2 SWAN.**

Passes closest to Earth (0.26 AU) on 18-21 October.

Earth may cross through debris in its orbit on 4-6 October possibly resulting in a meteor shower. **One to watch!**

**C/2025 A6 Lemmon.**

May reach 4<sup>th</sup> magnitude.

**C/2025 K1 ATLAS.**

**3I ATLAS.**

An Interstellar visitor!

Up to date details of comets can be found on the “Heavens above” and “spaceweather” websites.

Charts and details of selected comets are available at:

[http://brastastro.org/computing/charts\\_comet.html](http://brastastro.org/computing/charts_comet.html)

See also the *BAA Handbook* and monthly periodicals.

## Meteor Showers.

The **Orionids** are active from 2<sup>nd</sup> October to 7<sup>th</sup> November with **peak activity on 21<sup>st</sup>-22<sup>nd</sup>**, ZHR = 25. Debris associated with Halley’s comet. Favourable!

The **Southern Taurids** are active from 10<sup>th</sup> September to 20<sup>th</sup> November with peak activity on 5<sup>th</sup> November, ZHR = 5.

The **Northern Taurids** are active from 20<sup>th</sup> October to 10<sup>th</sup> December with peak activity on 12<sup>th</sup> November, ZHR = 5.

The **Taurids** showers can produce bright fireballs so worth keeping your eyes out.

There are always **Sporadic** events and the chance of a brilliant **Fireball**. The latter should be recorded and reported.

## Near Earth Objects.

Please refer to [www.spaceweather.com](http://www.spaceweather.com) for details and updates.

## Eclipses.

No Lunar or Solar Eclipses this month.

## 2. Deep Sky.

Abbreviations used.

**M** = Messier object. (Shown in **bold**).

NGC = New General Catalogue. IC = Index Catalogue. (Extension of the NGC).

ds = double star. ts = triple star. ms = multiple star. vs = variable star.

gc = globular cluster. oc = open cluster. pn = planetary nebula.

en = emission nebula. rn = reflection nebula. sg = spiral galaxy.

eg = elliptical galaxy. lg = lenticular galaxy. ir = irregular galaxy.

pg = peculiar galaxy. snr = super nova remnant. ly = light year.

The magnitude of an object, excluding double, triple, multiple and variable stars, is shown in brackets e.g. (6.5).

All magnitudes are + unless otherwise shown.

### 2.1 Variable Stars of the month.

**Beta (β) Persei, Algol.** Range 2.2 to 3.4, period 2.7 days. Becoming better placed for observation in the “early hours”. Minima at “social hours” occur on 16<sup>d</sup> 0.5<sup>h</sup> and 21<sup>d</sup> 18.2<sup>h</sup>.

**Delta (δ) Cephei.** Range 3.5 to 4.4, period 5.37 days. The prototype for the Cepheid class of variable stars. Their period-luminosity relationship has led them to being used as “standard candles” in measuring distances to nearby galaxies.

**Mu (μ) Cephei.** Range 3.7 to 5.0, approximate period 755 days. A semi-regular variable star famous for its striking red colour being fittingly called “Herschel’s Garnet Star”. It is the reddest naked eye star visible from the northern hemisphere. Its colour may show signs of variability.

### 2.2 Double Stars of the month.

**Gamma And.** See notes below.

**Zeta Aqr.** See notes below.

**94 Aqr.** See notes below.

**Alpha Cas.** See notes below.

**Iota Cas.** See notes below.

**Eta Cas.** See notes below.

**Sigma Cas.** See notes below.

**Delta Cep.** See notes below.

**Struve (Σ) 2816 & 2819 Cep.** See notes below.

**Struve (Σ) 2840 Cep.** See notes below.

**8 Lac.** Quadruple system. See notes below.

**Eta Peg.** See notes below.

**Pi<sup>1&2</sup> Peg.** See notes below.

**57 Peg.** See notes below.

**Zeta Psc.** See notes below.

**35 Psc.** See notes below.

**51Psc.** See notes below.

## 2.3 This Month's Constellations - Double Stars/Star Clusters/Nebulae/Galaxies.

### Andromeda (And).

Gamma ( $\gamma$ ) (2.2, 5.1) is a fine double star. The brighter component is golden-yellow with its companion a greenish-blue. Arguably second only to Albiro in Cygnus.

NGC205 (**M110**) (8.0) eg. A satellite galaxy of M31 visible as an elongated "smudge" in small telescopes.

NGC221 (**M32**) (8.2) eg. A satellite galaxy of M31. Visible as a fuzzy star in small telescopes.

NGC224 (**M31**) (3.5) sg. The Great Andromeda Spiral Nebula. Increasing aperture reveals more and more detail although increasingly smaller areas of the galaxy fill the eyepiece. 8" telescopes should reveal NGC206 as a hazy patch. It is a large area of star formation. 12" scopes will reveal one or two of M31's large population of globular clusters.

NGC404 (11.9) lg. Located 6' NW of  $\beta$  And. The 2nd magnitude star tends to drown the faint glow of the galaxy. Use high power to push the star out of the field of view for best results.

NGC752 (5.7) oc This large open cluster is located about 4 degrees south of  $\gamma$ .

NGC891 (10.1) sg. Located about 3 degrees east of  $\gamma$  is seen almost edge on. Bright central bulge. Moderate apertures will reveal a narrow dust lane bisecting the long axis. A fine object.

NGC7640 (12.5) sg. Seen nearly edge-on.

NGC7662 (8.6) pn. "The Blue Snowball". Rather small making it difficult to distinguish from nearby faint stars. High magnification on an 8" telescope will reveal an elliptical ring with a dark centre. Large apertures will show a faint second outer ring of nebulosity and the 13th magnitude central star.

### Aquarius (Aqr).

Beta ( $\beta$ ) is a triple star (2.9, 10.8 and 11.4, sep 35.4" and 57.2" from primary).

Zeta ( $\zeta$ ) ds (4.3,4.5 sep2.1". Probably requires a 6" telescope to split this pair of white. Larger scopes may show them as yellowish.

$\psi^1$  ds (4.5,10.8, sep 49.6"). Medium power reveals a wide pair of orange stars.

centre. Begins to resolve in apertures greater than 10".

94 ds (5.3,7.2, sep 12"). Fine pale red/pale green.

NGC6981 (**M72**) (9.3) gc. A distant cluster. Rather loose concentration and difficult to resolve.

NGC6994 (**M73**) (8.9) Asterism of 4 stars. Identify for curiosity to your Messier collection.

NGC7009 (8.3) pn "Saturn Nebula". Fine blue/green oval object in moderate aperture telescopes. Larger apertures reveal the faint antennae and hence the name. The Central star is visible in 16" telescopes.

NGC7089 (**M2**) (6.5) gc. Showpiece object! Bright compressed halo with bright core.

NGC 7293 (6.5) pn "Helix Nebula". RA 22h 29.6m Dec -20° 29.6m. It is possibly the nearest planetary nebula to us and hence its large angular size of 770". However it requires a dark site when even binoculars/low power small telescope should reveal its ghostly outline.

NGC7606 (10.8) sg. Faint elongated halo with brighter centre. Stellar nucleus visible in 12"+ apertures.

## Cassiopeia (Cas).

Alpha ( $\alpha$ ) (2.2/8.9 sep. 64.4'') ds. Fine orange and blue pair. Part of a multiple system.

Iota ( $\iota$ ) (4.6/6.9/8.4 sep. AB 2.5'', AC 7.2'') ts. Beautiful white, yellow and blue triple system.

Eta ( $\eta$ ) (3.4/7.5 sep. 12.9'') ds. Superb gold and garnet pair. The colours are very subjective. What do you see?

Sigma ( $\sigma$ ) (5.0/7.1 sep. 3.0'') ds. Bluish white and yellow pair in a superb field.

NGC129 (6.5) oc.

NGC147 (9.3) eg. A satellite galaxy of M31.

NGC185 (9.2) eg. A satellite galaxy of M31.

NGC278 (10.9) eg. Located a few degrees SE of NGC185.

NGC457 (6.4) oc. The "Owl Cluster". Fine object.

NGC581 (**M103**) (7.4) oc. Fine object.

NGC7654 (**M52**) (6.9) oc. Fine rich cluster.

NGC7789 (6.7) oc. "Caroline's (Herschel) Rose". Very fine object.

NGC7790 (8.5) oc.

IC1805 (6.5) oc.

IC1848 (6.5) oc.

## Cepheus (Cep).

Delta ( $\delta$ ) Cephei, 3.5 to 4.4 over a period 5.37 days, is the prototype for the Cepheid class of variable stars which because of their period-luminosity relationship has lead them to being used as "standard candles" in measuring distances to nearby galaxies. Pale blue +6.1 companion. Two types of object for the price of one!

Mu ( $\mu$ ) Cephei 3.7 to 5.0 approximate period 755 days is a semi-regular variable star. It is more famous for its striking red colour being fittingly called "Herschel's Garnet Star". It is the reddest naked eye star visible from the northern hemisphere. Its colour may show signs of variability.

Struve ( $\Sigma$ ) 2816 ts (5.7/7.5/7.5, sep 12''/20''). Fine triple with Struve ( $\Sigma$ ) 2819 ds (7.4/8.6, sep 13'') in same field. All contained in the large, sparse and nebulous open cluster IC 1396!

Struve ( $\Sigma$ ) 2840 ds (5.6/6.4, sep 18''). Very fine greenish/bluish pair.

Open clusters - NGC188 (8.1), NGC6939 (7.8), NGC7510 (7.9), NGC7762(10.0).

Planetary Nebula NGC40 (10.7).

Spiral galaxy NGC6946 (8.9) in the same one degree field as open cluster NGC6939.

The faint reflection nebula NGC7023 and emission nebula IC 1396 provide a challenge to the observer. A dark clear sky is essential.

## Lacerta (Lac).

Struve ( $\Sigma$ ) 2876 (7.8/9.3 sep 11.8'') ds. Fine blue and white double.

Struve ( $\Sigma$ ) 2894 (6.1/8.3 sep. 15.6'') ds. Yellow primary, blue secondary.

Struve ( $\Sigma$ ) 2902 (7.6/8.5 sep. 6.4'') ds. Yellow and white double.

8 Lacertae = Struve ( $\Sigma$ ) 2922 (5.7/6.5 sep. 22.4'') Multiple star. Brightest four components are white/blueish white. Has been described as a poor open cluster.

O Struve ( $\Sigma$ ) 475 (6.8/10.8 sep. 15.5'') ds. White primary with faint blue companion.

BL Lacertae (14 to 17). Prototype for class of quasi-stellar object (QSO).

## Pegasus (Peg).

Eta ( $\eta$ ) (2.9/9.9 sep 90.4'') ds. Binocular object. Yellow and blue components but telescope required to see colour of secondary. Herschel's "Pendulum Star" - tap telescope gentle for the effect.

Pi<sup>-1</sup>/Pi<sup>2</sup> ( $\pi^{-1}/\pi^2$ ) (5.6/4.3 sep 7') ds. Fine binocular object. Pi<sup>-1</sup> is a multiple system with 4 companions of 10<sup>th</sup> to 12<sup>th</sup> magnitude.

51 Pegasi. (+5.5). The first Exoplanet was discovered orbiting this star 1995.

57 Pegasi. (5.1/9.7 sep 32.6'') ds. Beautiful orange primary with blue companion.

NGC7078 (**M15**) (6.3) gc superb object.

NGC7331 (9.5) sg. Seen almost edge on.

About half a degree south of NGC7331 is a fascinating group of galaxies "Stephan's Quintet". The brightest member of the group is NGC7320 (12.7).

Many happy hours can be spent wandering around "The Square" to locate many moderately bright galaxies. Use "Stellarium" and/or a star atlas such as the excellent "Sky Atlas 2000" to plan your journey.

## Pisces (Psc).

Alpha ( $\alpha$ ) (4.2/5.1 sep.1.5'') ds. Requires a large aperture telescope using high magnification to split this pair of bluish-white stars.

Zeta ( $\zeta$ ) (5.6/6.2 sep. 23'') ds. Fine white and yellow pair of stars.

35 (6.0/7.6 sep 7.6'') ds. Fine yellow and blue pair.

51 (5.7/9.5 sep.27.5'') ds. Glorious bluish and greenish pair of stars.

65 (6.3/6.3 sep 4.4'') ds. Fine matched pair of pale yellow stars.

Wolf 28 (12.3). "Van Maanen's Star". One of the few white dwarf stars visible in amateur telescopes.

NGC128 (11.8) sg. Brightest of a group of five galaxies.

NGC488 (10.3) sg. Elongated halo with brighter core.

NGC628 (**M74**) (9.4) sg. Seen face on and hence low surface brightness.

NGC7541 (11.7) sg. Elongated oval with bright core. 3' to the SW is NGC7537 (13.0).

## Pisces Austrinus (Psa).

Alpha (1.2) Formalhaut. The most southerly first magnitude star visible from the UK. A young star encircled by a disc of gas and dust indicating planetary formation.

P.V.H.
